

Table of Contents

Executive Summary

Part 1: Nanotechnology and Green Building

1. Introduction

- 1.1 Green Building
- 1.2 Nanotechnology
- 1.3 Convergence

Part 2: Materials

2. Insulation

- 2.1 Aerogel
- 2.2 Thin-film insulation
- 2.3 Insulating coatings
- 2.4 Emerging insulation technologies
- 2.5 Future market for nano-insulation

3. Coatings

- 3.1 Self-cleaning coatings
- 3.2 Anti-stain coatings
- 3.3 Depolluting surfaces
- 3.4 Scratch-resistant coatings
- 3.5 Anti-fogging and anti-icing coatings
- 3.6 Antimicrobial coatings
- 3.7 UV protection
- 3.8 Anti-corrosion coatings
- 3.9 Moisture resistance

4. Adhesives

5. Lighting

- 5.1 Light-emitting diodes (LEDs)
- 5.2 Organic light-emitting diodes (OLEDs)
- 5.3 Quantum dot lighting
- 5.4 Future market for lighting

6. Solar energy

- 6.1 Silicon solar enhancement
- 6.2 Thin-film solar nanotechnologies
- 6.3 Emerging solar nanotechnologies

7. Energy storage

8. Air purification

9. Water purification

10. Structural materials

- 10.1 Concrete
- 10.2 Steel
- 10.3 Wood
- 10.4 New structural materials

11. Non-structural materials

- 11.1 Glass
- 11.2 Plastics and polymers
- 11.3 Drywall
- 11.4 Roofing

Part 3: Conclusions

12. Additional benefits

- 12.1 Nanosensors and smart environments
- 12.2 Multifunctional properties
- 12.3 Reduced processing energy
- 12.4 Adaptability to existing buildings

13. Market forces

- 13.1 Forces accelerating adoption
- 13.2 Obstacles to adoption

14. Future trends and needs

- 14.1 Independent testing
- 14.2 Life cycle analysis
- 14.3 Societal concerns
- 14.4 Environmental and human health concerns
- 14.5 Regulation
